

### **Amendments to the Claims:**

1-8 Cancelled.

9. (New) A child seat for mounting on a vehicle seat having a seat surface which is inclined forward and upward in the direction of travel, the child seat having a base part and a seat shell arranged on the base part, the base part having a base area with a front base area section and with a rear base area section, which base area sections enclose an obtuse angle with each other, and a wedge element bearing either against the front or the rear base area section, the wedge element and the front and rear base area sections, which are matched to one another, being designed in such a manner that the wedge element and the respective base area section adjoining the wedge element form a common level bearing surface, characterized in that the wedge element can be displaced on the base part along a guide.

10. (New) The child seat as claimed in claim 9, characterized in that the wedge element has at least one hollow space which is accessible from the outside and forms a storage space.

11. (New) The child seat as claimed in claim 10, characterized in that the hollow space can be closed.

12. (New) The child seat as claimed in claim 9, characterized in that the seat shell can be displaced to and fro on the base part between different positions.
